Let $x_c$ denote the path on which $\mathcal{L}(x)$ attains its minimum value, write $x = x_c + x_q$ with $x_q \in W_{00}$, and get

$$\psi(T,x) = c\int dx_0\psi_0(x_0)\int_{W_{00}} \mathcal{D}x_q e^{i\mathcal{L}(x_c+x_q)}.$$

In our particular case $\mathcal{L}$ is quadratic in $x$, and therefore $\mathcal{L}(x_c+x_q) = \mathcal{L}(x_c)+\mathcal{L}(x_q)$ (this uses the fact that $x_c$ is an extremal of $\mathcal{L}$, of course). Plugging this into what we already have, we get

$$\begin{aligned}\psi(T,x) &= c\int dx_0\psi_0(x_0)\int_{W_{00}} \mathcal{D}x_q e^{i\mathcal{L}(x_c)+i\mathcal{L}(x_q)} \\ &= c\int dx_0\psi_0(x_0)e^{i\mathcal{L}(x_c)}\int_{W_{00}} \mathcal{D}x_q e^{i\mathcal{L}(x_q)}.\end{aligned}$$

Now this is excellent news, because the remaining path integral over $W_{00}$ does not depend on $x_0$ or $x_n$, and hence it is a constant! Allowing $c$ to change its value from line to line, we get

$$\psi(T,x) = c\int dx_0\psi_0(x_0)e^{i\mathcal{L}(x_c)}.$$

Lemma 3.4 now shows us that $x_c(t) = x_0\cos t + x_n \sin t$. An easy explicit computation gives $\mathcal{L}(x_c) = -x_0x_n$, and we arrive at our final result,

$$\psi(\frac{\pi}{2},x) = c\int dx_0\psi_0(x_0)e^{-ix_0x_n}.$$

Notice that this is precisely the formula for the Fourier transform of $\psi_0$! That is, the answer to the question in the title of this document is "the particle gets Fourier transformed", whatever that may mean.

## 3. The Lemmas

**Lemma 3.1.** *For any two matrices $A$ and $B$,*

$$e^{A+B} = \lim_{n\to\infty}\left(e^{A/n}e^{B/n}\right)^n.$$

*Proof.* (sketch) Using Taylor expansions, we see that $e^{\frac{A+B}{n}}$ and $e^{A/n}e^{B/n}$ differ by terms at most proportional to $c/n^2$. Raising to the $n$th power, the two sides differ by at most $O(1/n)$, and thus

$$e^{A+B} = \lim_{n\to\infty}\left(e^{\frac{A+B}{n}}\right)^n = \lim_{n\to\infty}\left(e^{A/n}e^{B/n}\right)^n,$$

as required. □

**Lemma 3.2.**

$$\left(e^{itV}\psi_0\right)(x) = e^{itV(x)}\psi_0(x).$$

□

**Lemma 3.3.**

$$\left(e^{i\frac{t}{2}\Delta}\psi_0\right)(x) = c\int dx' e^{i\frac{(x-x')^2}{2t}}\psi_0(x').$$

*Proof.* In fact, the left hand side of this equality is just a solution $\psi(t,x)$ of Schrödinger's equation with $V=0$:

$$\frac{\partial\psi}{\partial t} = \frac{i}{2}\Delta_x\psi, \qquad \psi|_{t=0} = \psi_0.$$

Taking the Fourier transform $\tilde\psi(t,p) = \frac{1}{\sqrt{2\pi}}\int e^{-ipx}\psi(t,x)dx$, we get the equation

$$\frac{\partial\tilde\psi}{\partial t} = -i\frac{p^2}{2}\tilde\psi, \qquad \tilde\psi|_{t=0} = \tilde\psi_0.$$

For a fixed $p$, this is a simple first order linear differential equation with respect to $t$, and thus,

$$\tilde\psi(t,p) = e^{-i\frac{tp^2}{2}}\tilde\psi_0(p).$$

Taking the inverse Fourier transform, which takes products to convolutions and Gaussians to other Gaussians, we get what we wanted to prove. □

**Lemma 3.4.** *With the notation of Section 2 and at the specific case of $V(x) = \frac{1}{2}x^2$ and $T = \frac{\pi}{2}$, we have*

$$x_c(t) = x_0\cos t + x_n\sin t.$$

*Proof.* If $x_c$ is a critical point of $\mathcal{L}$ on $W_{x_0x_n}$, then for any $x_q \in W_{00}$ there should be no term in $\mathcal{L}(x_c+\epsilon x_q)$ which is linear in $\epsilon$. Now recall that

$$\mathcal{L}(x) = \int_0^T dt\left(\frac{1}{2}\dot x^2(t) - V(x(t))\right),$$

so using $V(x_c+\epsilon x_q) \sim V(x_c) + \epsilon x_q V'(x_c)$ we find that the linear term in $\epsilon$ in $\mathcal{L}(x_c+\epsilon x_q)$ is

$$\int_0^T dt\left(\dot x_c\dot x_q - V'(x_c)x_q\right).$$

Integrating by parts and using $x_q(0) = x_q(T) = 0$, this becomes

$$\int_0^T dt\left(-\ddot x_c - V'(x_c)\right)x_q.$$

For this integral to vanish independently of $x_q$, we must have $-\ddot x_c - V'(x_c) \equiv 0$, or

$$\ddot x_c = -V'(x_c). \qquad \left(\text{This is the famous } F = ma \text{ of Newton's, and we have just rediscovered the principle of least action!}\right)$$

In our particular case this boils down to the equation

$$\ddot x_c = -x_c, \qquad x_c(0) = x_0, \qquad x_c(\pi/2) = x_n,$$

whose unique solution is displayed in the statement of this lemma. □
