Dror Bar-Natan: Talks: Hamburg-1208

Local Khovanov Homology (1)

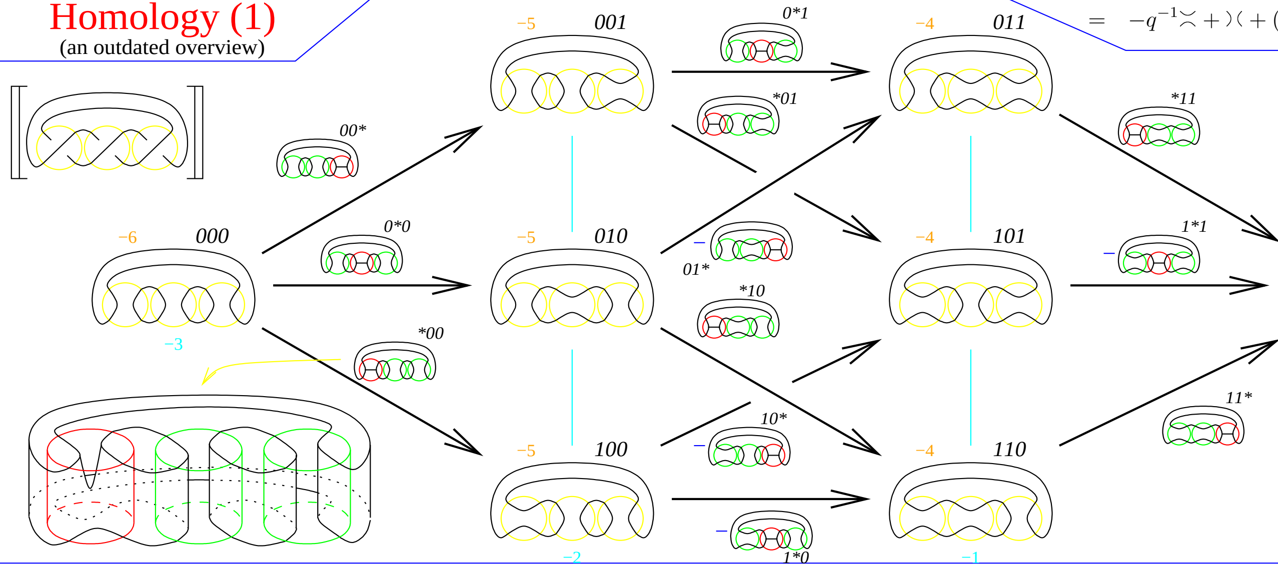
(an outdated overview)

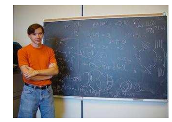
The Jones polynomial: $\bigcirc^k \mapsto (q+q^{-1})^k$

$J : \text{(positive crossing)} \mapsto q)(- q^2 \asymp, \quad J : \text{(negative crossing)} \mapsto -q^{-2}\asymp + q^{-1})($

R2

$J : \text{(R2 tangle)} \mapsto -q^{-1}(\ldots) + (\ldots) + (\ldots) - q(\ldots)$
$= -q^{-1}\asymp +)(+ (q+q^{-1})\asymp - q\asymp =)($



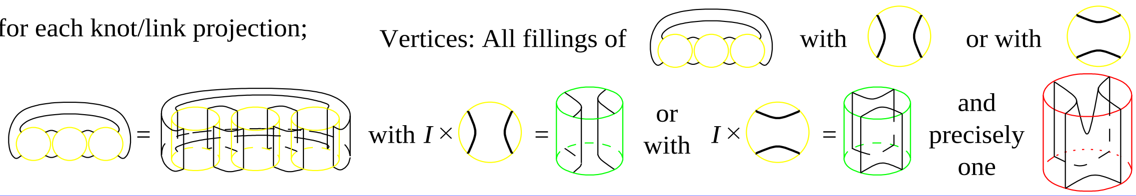


Mikhail Khovanov

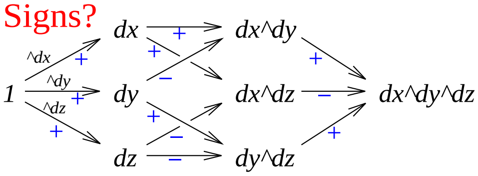
What is it?

A cube for each knot/link projection; Vertices: All fillings of (the diagram) with)(or with $\asymp$.

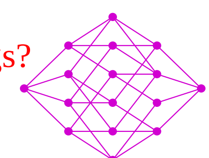
Edges: All fillings of $I \times$ (the diagram) = (the cobordism) with $I \times)(=$ (cobordism) or with $I \times \asymp =$ (cobordism) and precisely one (saddle).



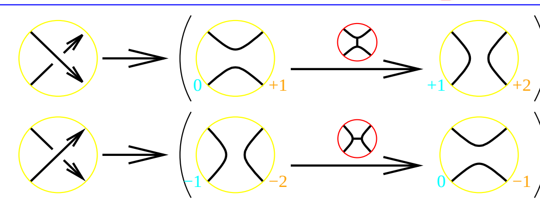
Signs?



More crossings?



General Crossings



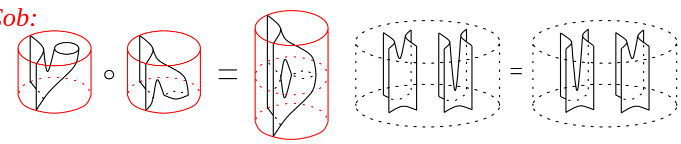
Where does it live?

In *Kom(Mat(<Cob> / {S, T, G, NC})) / homotopy*

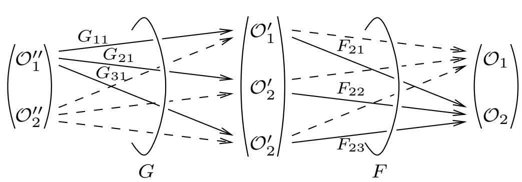
Kom: Complexes Mat: Matrices

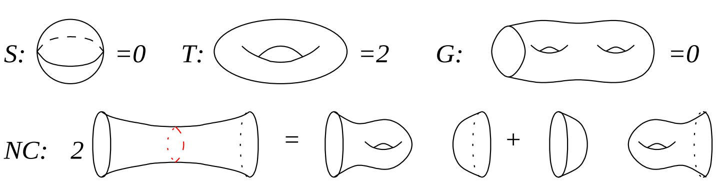
Cob: Cobordisms <...>: Formal lin. comb.

Cob:



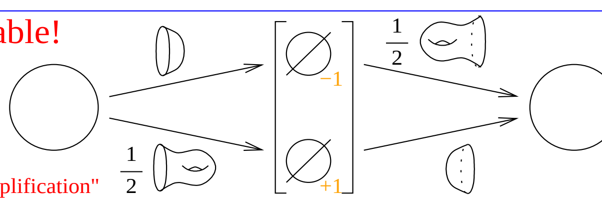
Mat(C):





Computable!

via "complex simplification"



Complexes:

$$\Omega = \left(\Omega^{-n_-} \longrightarrow \Omega^{-n_-+1} \longrightarrow \cdots \qquad \longrightarrow \Omega^{n_+} \right)$$

Morphisms:

$$\begin{array}{ccccccccc} \cdots \longrightarrow & \Omega_0^{r-1} & \xrightarrow{d^{r-1}} & \Omega_0^r & \xrightarrow{d^r} & \Omega_0^{r+1} & \longrightarrow \cdots \\ & \downarrow F^{r-1} & & \downarrow F^r & & \downarrow F^{r+1} & \\ \cdots \longrightarrow & \Omega_1^{r-1} & \xrightarrow{d^{r-1}} & \Omega_1^r & \xrightarrow{d^r} & \Omega_1^{r+1} & \longrightarrow \cdots \end{array}$$

Homotopies:

$$\begin{array}{ccccc} \Omega_0^{r-1} & \xrightarrow{d^{r-1}} & \Omega_0^r & \xrightarrow{d^r} & \Omega_0^{r+1} \\ F^{r-1}\Downarrow G^{r-1} & \swarrow h^r & F^r \Downarrow G^r & \swarrow h^{r+1} & F^{r+1} \Downarrow G^{r+1} \\ \Omega_1^{r-1} & \xrightarrow{d^{r-1}} & \Omega_1^r & \xrightarrow{d^r} & \Omega_1^{r+1} \end{array}$$

$$F^r - G^r = h^{r+1}d^r + d^{r-1}h^r$$

All arrows in an additive category!

The Main Point. "The cube", $\mathrm{Kh}(L)$, is an up-to-homotopy invariant of knots and links. It's Euler characteristic is the Jones polynomial, yet it is strictly stronger than the Jones polynomial. It is functorial (in the appropriate sense) and practically computable.

The Categorification Speculative Paradigm.
- Every object in math is the Euler characteristic of a complex.
- Every operation lifts to an operation between complexes.
- Every identity remains true, up to homotopy.
