

The Hardest Math I've Ever Really Used, 1

Abstract. What's the hardest math I've ever used in real life? Me, myself, directly - not by using a cellphone or a GPS device that somebody else designed? And in "real life" — not while studying or teaching mathematics?

I use addition and subtraction daily, adding up bills or calculating change. I use percentages often, though mostly it is just "add 15 percents". I seldom use multiplication and division: when I buy in bulk, or when I need to know how many tiles I need to replace my kitchen floor. I've used powers twice in my life, doing calculations related to mortgages. I've used a tiny bit of geometry and algebra for a tiny bit of non-math-related computer graphics I've played with. And for a long time, that was all. In my talk I will tell you how recently a math topic discovered only in the 1800s made a brief and modest appearance in my non-mathematical life. There are many books devoted to that topic and a lot of active research. Yet for all I know, nobody ever needed the actual formulas for such a simple reason before.

Hence we'll talk about the motion of movie cameras, and the fastest way to go from A to B subject to driving speed limits that depend on the locale, and the "happy segway principle" which is at the heart of the least action principle which in itself is at the heart of all of modern physics, and finally, about that funny discovery of Janos Bolyai's and Nikolai Ivanovich Lobachevsky's, that the famed axiom of parallels of the ancient Greeks need not actually be true.

Non-Commutative Gaussian Elimination and Rubik's Cube

The Problem. Let $G = (g_1, \dots, g_n)$ be a subgroup of S_n , with $n = O(100)$. Before you die, understand G :

1. Compute $|G|$.
2. Given $\sigma \in S_n$, decide if $\sigma \in G$.
3. Write a $\sigma \in G$ in terms of g_1, \dots, g_n .
4. Produce random elements of G .

The Commutative Analog. Let $V = \text{span}(v_1, \dots, v_n)$ be a subspace of \mathbb{R}^n . Before you die, understand V .

Solution: Gaussian Elimination. Prepare an empty table.

1	2	3	4	...	n-1	n
---	---	---	---	-----	-----	---

Space for a vector $u_i \in V$, of the form $u_i = (0, 0, 0, 1, *, \dots, *)$; $1 = \text{"the pivot"}$

Feed v_1, \dots, v_n in order. To feed a non-zero v , find its pivotal position i .

1. If box i is empty, put v there.
2. If box i is occupied, find a combination v' of v and u_i that eliminates the pivot, and feed v' .

Non-Commutative Gaussian Elimination
Prepare a mostly-empty table.

1,1						
1,2	2,2					
1,3	2,3	3,3				
			4,3			
1,n	2,n	3,n			n,n	

Space for a $\sigma_{i,j} \in S_n$ of the form $(1, 2, \dots, i-2, i-1, j, *, *, \dots, *)$
So $\sigma_{i,j}$ fixes $1, \dots, i-1$, and sends "the pivot" i to j and goes wild afterwards, and $\sigma_{i,j}^{-1}$ "does sticker j ".

Feed g_1, \dots, g_n in order. To feed a non-identity σ , find its pivotal position i and let $j := \sigma(i)$.

1. If box (i, j) is empty, put σ there.
2. If box (i, j) contains $\sigma_{i,j}$, feed $\sigma' := \sigma_{i,j}^{-1} \sigma$.

The Twist. When done, for every occupied (i, j) and (k, l) , feed $\sigma_{i,j} \sigma_{k,l}$. Repeat until the table stops changing.

Claim. The process stops in our lifetimes, after at most $O(n^6)$ operations. Call the resulting table T .

Claim. Anything fed in T is a monotone product in T :
 f was fed $\Rightarrow f \in M_1 := \{\sigma_{1,j_1} \sigma_{2,j_2} \dots \sigma_{n,j_n} : \forall i, j_i \geq i \ \& \ \sigma_{i,j_i} \in T\}$

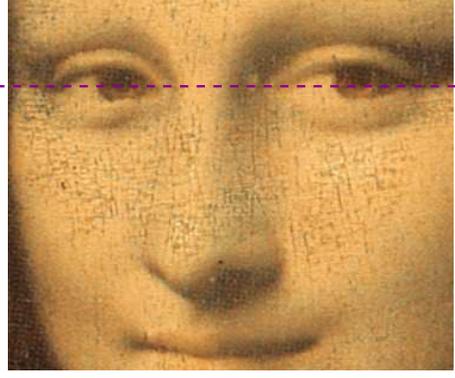

Homework Problem 1. Can you do cosets?

Homework Problem 2. Can you do categories (groupoids)?

The Results
In[3] := {Feed[#]; Product[1 + Length[Select[Range[n], Head[s[[1, #]] == # &]], {s, s[[1, #]]} & /@ gs
Out[3] = {4, 16, 15999350169000, 21119142223872000, 4325200327448986000, 4325200327448986000}

I could be a mathematician ...

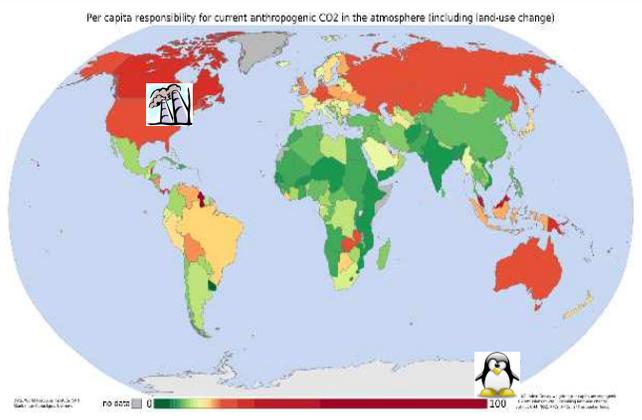

...or an art historian...

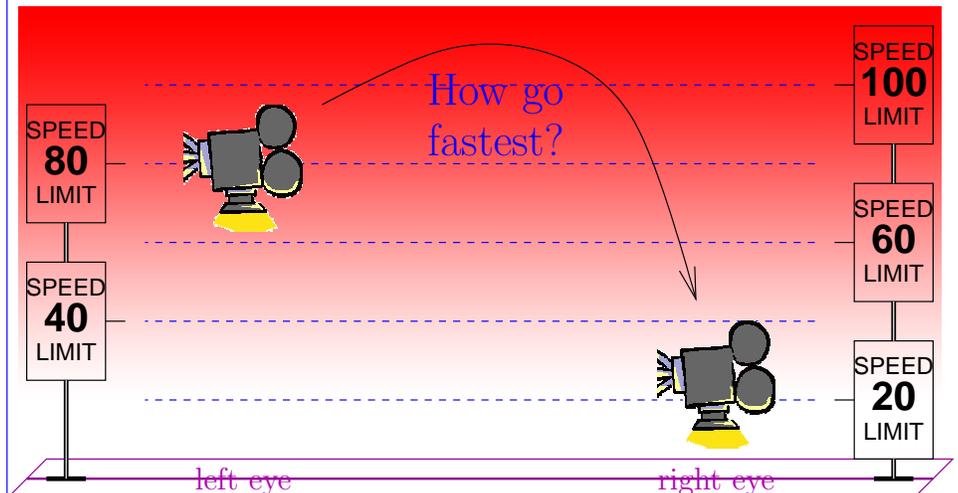

...or an environmentalist.

Goal. Find the least-blur path to go from Mona's left eye to Mona's right eye in fixed time. Alternatively, fix your blur-tolerance, and find the fastest path to do the same. For fixed blur, our camera moves at a speed proportional to its distance from the image plane:

The Least Action Principle. Everywhere in physics, a system goes from A to B along the path of least action.

With small print for quantum mechanics.

ParametricPlot3D[{
 $\text{Sin}[u] \text{Cos}[v]$,
 $\text{Sin}[u] \text{Sin}[v]$,
 $\text{Cos}[u]$
}, {u, 0, π }, {v, 0, 2π }]

The Happy Segway Principle

A Segway is happy iff both its wheels are

ParametricPlot3D[{
 $\text{Sech}[u] \text{Cos}[v]$,
 $\text{Sech}[u] \text{Sin}[v]$,
 $u - \text{Tanh}[u]$
}, {u, 0, e }, {v, 0, 2π }]

Happy camera-carrying Segways above the Mona Plane

Unhappy Segway
