Analysis Exam (3 hours)

September 1998

No aids.
Do all questions.
Questions will be weighted equally.

1. The measure here is the Lebesgue measure on $\mathbb{R}$.
   (a) Prove that if $f \in L^{p_1}(\mathbb{R}) \cap L^{p_2}(\mathbb{R})$, then $f \in L^q(\mathbb{R})$ for all $p_1 \leq q \leq p_2$.
   (b) Produce a function $f$ such that $f \in L^p(\mathbb{R})$ only when $p = 2$.

2. (a) State the definition of a bounded (continuous) linear operator between two Banach spaces.
   (b) Prove that the kernel of a bounded operator is closed.
   (c) Prove that, if the kernel is closed, a linear functional is bounded.

3. (a) State Parseval’s formula for Fourier Series.
   (b) Prove that $\sum_{n=1}^{\infty} n^{-2} = \pi^2/6$. Hint. Use the Fourier series expansion for $f(x) = x$.
   (c) Let $f$ be such that

   $$|\hat{f}(n)| \leq C|n|^{-k}$$

   for all $k > 0$. Prove that $f \in C^\infty$.

4. (a) State the uniform boundedness theorem (Banach Steinhaus) on Banach Spaces.
   (b) Let $f$ be measurable such that $f \cdot g \in L^1$ for all $g \in L^q$. Show that $f \in L^p$ (1/p + 1/q = 1).
5. (a) Give a complex-analytic proof of the fundamental theorem of algebra: every nonconstant holomorphic polynomial with complex coefficients has a root.

(b) Prove the Casorati-Weierstrass theorem: Suppose $f$ is analytic in the set $0 < |z - a| < R$ and has an essential singularity at $a$. Then the range of $f$ is dense in $\mathbb{C}$.

6. Verify that

$$w = \frac{(1 + z^n)^2 - i(1 - z^n)^2}{(1 + z^n)^2 + i(1 - z^n)^2}$$

transforms the circular sector $0 < |z| < 1, 0 < \operatorname{Arg} z < \frac{\pi}{n}$ onto the unit disc.
