

```

Conversions  $\mathcal{A} \leftrightarrow \Gamma$ :
r@A[is_, os_, cs_, w_] := Module[{i, j, w = Coefficient[w, Wedge[_]]},
  r[is, os, cs, w, Sum[Cancel[-Coefficient[w, x_j  $\wedge$  e_i] e_i  $\wedge$  x_j / w],
  {i, is}, {j, os}]];
];
r@Gamma[is_, os_, cs_, w_, l_]:= 
r[is, os, cs, Expand[w WEExp[Expand[l] /. {e_a  $\wedge$  x_b_  $\Rightarrow$  e_a  $\wedge$  x_b}]]];

```

The conversions are inverses of each other:

```

r[{1, 2, 3}, {1, 2, 3}, {x1  $\rightarrow$  t1, x2  $\rightarrow$  t2, x3  $\rightarrow$  t3, e1  $\rightarrow$  t1, e2  $\rightarrow$  t2, e3  $\rightarrow$  t3},
  w, a11 x1 e1 + a12 x2 e1 + a13 x3 e1 + a21 x1 e2 + a22 x2 e2 + a23 x3 e2 + a31 x1 e3 +
  a32 x2 e3 + a33 x3 e3];

```

```
r@A@Y == Y
```

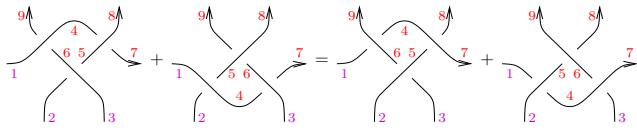

True

The conversions commute with contractions:

```
r@c3,3@A@Y == C3,3@Y
```

True

Conway's Third Identity

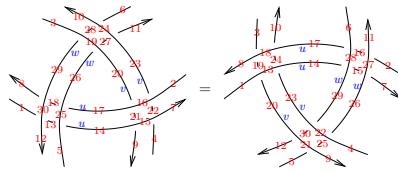

Sorry, Γ has nothing to say about that...'

[1.28125, True]

What I still don't understand.

- ▶ What becomes of $c_{x, \zeta} e^\lambda$ if we have to divide by 0 in order to write it again as an exponentiated quadratic? Does it still live within a very small subset of $\Lambda(\mathcal{X} \sqcup X)$?
- ▶ How do cablings and strand reversals fit within \mathcal{A} ?
- ▶ Are there “classicality conditions” satisfied by the invariants of classical tangles (as opposed to virtual ones)?
