A. \(-2\)
B. \(-3\)
C. \(-1\)
D. \(-4\)
E. \(-6\)

\[6x^2 + 2xy + x^2\frac{dy}{dx} + 3y^2\frac{dy}{dx} = 0\]

At (1, 1): \(6 + 2 + \frac{dy}{dx} + 3\frac{dy}{dx} = 0\)

\[\frac{4}{3}\frac{dy}{dx} = -8\] and \(\frac{dy}{dx} = -2\)  \(\text{A}\)

or:

\[(x^2 + 3y^2)\frac{dy}{dx} = -(6x^2 + 2xy)\]

\[\frac{dy}{dx} = \frac{-(6x^2 + 2xy)}{x^2 + 3y^2} = -2\] at (1, 1).

Let \(f(x) = x^3 - 9x^2 + 15x\) be defined only on the interval \([0, 7]\), that is, for \(0 \leq x \leq 7\). Then which one of the following is true?

A. \(f\) takes on its absolute maximum and minimum values at the endpoints.
B. \(f\) takes on its absolute maximum value at two points.
C. \(f\) has no absolute maximum or minimum.
D. \(f\) takes on its absolute minimum value at an endpoint.
E. \(f\) takes on its absolute minimum value at two points.

Since \(f\) is cont. on the closed interval \([0, 7]\), it must take on an absolute min value and an absolute max value (C is false).

\[f'(x) = 3x^2 - 18x + 15 = 3(x^2 - 6x + 5) = 3(x - 5)(x - 1)\]

crit. pts. are \(x = 1\) and \(x = 5\).

The candidates for max and min:

\[
\begin{align*}
x &= 0 & f(x) &= 0 \\
x &= 1 & f(x) &= 7 \text{ max} \\
x &= 5 & f(x) &= -25 \text{ min (A and D are false)} \\
x &= 7 & f(x) &= 7 \text{ max}

\[(1.04)^2 = (1 + i)^{12} \quad (1.04)^{-20} = (1 + i)^{-120}\]

\[600,000 = R \alpha_{120i} \]
\[R = \frac{600,000i}{1 - (1 + i)^{-120}} = \frac{600,000[(1.04)^{1/6} - 1]}{1 - (1.04)^{-20}}\]
\[R = 7238.45\]

Immediately after the 5th year of the mortgage, the interest rate changes to 6\% compounded semiannually. Find the new monthly payment required if the mortgage is still to be repaid in a total of 10 years.

Principal outstanding (with 60 payments remaining) = \(R \alpha_{60i}\)

\[= \frac{600,000}{1 - (1 + i)^{-60}} \]
\[= 600,000 \left[\frac{1 - (1 + i)^{-60}}{i}\right] \]
\[= 600,000 \left[\frac{1 - (1 + i)^{-120}}{i}\right] \]
\[= 600,000 \left[\frac{1 - (1.04)^{-10}}{i}\right] \]
\[= \$358,088.24\]

P.O. = \(R' \alpha_{60i}\)

\[(1.03)^2 = (1 + i')^{12} \quad (1.03)^{-10} = (1 + i')^{-60}\]

\[R' = \frac{358,088.34}{\alpha_{60i'}} = 358,088.34 \left[\frac{(1.03)^{1/6} - 1}{1 - (1.03)^{-10}}\right]\]
\[R' = \$6910.59\]

BigBoxCompany wants to choose how many televisions to keep in stock constantly throughout the year in its warehouse so as to minimize its annual cost. The annual cost $C$ of keeping $q$ televisions constantly in stock is given by

$$ C(q) = 5q + \frac{200,000}{q} + 1000 $$

for $q > 0$.

(a) [5 marks]
What is the minimum cost if $0 < q \leq 100$? (Justify your answer.)

$$ \frac{dC}{dq} = 5 - \frac{200,000}{q^2} = 0 \text{ when } q^2 = \frac{200,000}{5} = 40,000 \text{ i.e. when } q = 200 $$

On the interval $(0, 100]$, $C$ is decreasing, so its minimum value is at $q = 100$

when $C = 5 \cdot 100 + \frac{200,000}{100} + 1000$

$C = 3500$

The warehouse decides to increase its capacity. If the annual cost function remains the same no matter what they do, how much capacity would they need to have the absolute minimum cost? (Justify your answer.)

Since $C$ decreases all the way to $q = 200$, and increases forever afterward, the minimum cost will be at $q = 200$.

Evaluate the following integrals

(a) [6 marks]
\[
\int_{1}^{\infty} x^2 e^{-x} \, dx
\]
\[
= \lim_{R \to \infty} \int_{1}^{R} x^2 e^{-x} \, dx
\]
\[
u = x^2 \quad du = 2xe^{-x} \, dx
\]
\[
u = e^{-x} \quad dv = dx
\]
\[
\int_{1}^{\infty} x^2 e^{-x} \, dx = \lim_{R \to \infty} \left[ -x^2 e^{-x} \bigg|_{1}^{R} + 2 \int_{1}^{R} xe^{-x} \, dx \right]
\]
\[
\int_{1}^{\infty} xe^{-x} \, dx = \lim_{R \to \infty} \left[ -xe^{-x} \bigg|_{1}^{R} + \int_{1}^{R} e^{-x} \, dx \right]
\]
\[
= \lim_{R \to \infty} \left[ -Re^{-R} + e^{-1} - e^{-R} + e^{-1} \right] = 5e^{-1} - \lim_{R \to \infty} e^{-R}(R^2 + 2R + 2)
\]
but \( \lim_{R \to \infty} \frac{R^2 + 2R + 2}{e^R} = 0 \) by two applications of L'Hôpital

so \( 5e^{-1} \)

\[
\int \frac{3x - 2}{x^3 + 2x^2} \, dx
\]
\[
\frac{3x - 2}{x^3 + 2x^2} = A + B \frac{1}{x} + C \frac{1}{x + 2}
\]
\[
Ax(x + 2) + B(x + 2) + Cx^2 = 3x - 2
\]
\[
x = 0 \quad \Rightarrow 2B = -2 \quad B = -1
\]
\[
x = -2 \quad \Rightarrow 4C = -8 \quad C = -2
\]
\[
x = -1 \quad \Rightarrow -A + B + C = -5
\]
\[
-(-1) + (-2) = -5
\]
\[
-A = 2 \quad A = 2
\]
\[
\int \left[ \frac{2}{x} - \frac{1}{x^2} - \frac{2}{x + 2} \right] \, dx
\]
\[
= 2 \ln|x| + \frac{1}{x} - 2 \ln|x + 2| + C
\]
or \( 2 \ln \left| \frac{x}{x + 2} \right| + \frac{1}{x} + C \)

The marginal cost of producing widgets is given by \( \frac{dC}{dq} = \frac{1}{q^2} + e^{1-q} \) where \( q \) is the number of widgets and \( C \) is the total cost function. Given that \( C(1) = 7 \), find the total cost (to 2 decimal places) of producing \( q = 5 \).

\[
C = \int \left( \frac{1}{q^2} + e^{1-q} \right) dq = -\frac{1}{q} - e^{1-q} + K
\]

\[7 = -1 - e^0 + K \Rightarrow K = 9 \]

\[C = -\frac{1}{q} - e^{1-q} + 9 \]

\[C(5) = -\frac{1}{5} - e^{-4} + 9 = 8.8 - e^{-4} = 8.78 \text{ to 2 places} \]

\[
\frac{dy}{y} = \sqrt{x(1-x)} = x^{-1/2} - x^{3/2}
\]

\[

\[|y| = e^Kx^{3/2} - \frac{1}{2}x^{5/2} \]

and if \( D = \pm e^K \)

Find and classify the critical points of
\[ f(x, y) = x^2 - xy + y^2 - 2x + y \]

\[
\begin{align*}
&f_x = 2x - y - 2 = 0 \quad 2x - y = 2 \\
&f_y = -x + 2y + 1 = 0 \quad -x + 2y = -1
\end{align*}
\]

The only critical point is \( x = 1, y = 0 \)

\[ f_{xx} = 2 \quad f_{yy} = 2 \quad f_{xy} = -1 \]

\[ D = f_{xx}f_{yy} - (f_{xy})^2 = 4 - 1 = 3 > 0 \] so local extremum and \( f_{xx} > 0 \) so \([\text{local min}](1,0)\) is a local min.

(b) [6 marks]
Use Lagrange multipliers to find all critical points of
\[ f(x, y) = x^{1/2}y^{3/4} \]

subject to the constraint
\[ x + 2y = 30 \]

Note: No marks will be assigned to another method of solution.

\[ \mathcal{L} = x^{1/2}y^{3/4} - \lambda(x + 2y - 30) \]

\[ \mathcal{L}_x = \frac{1}{2}x^{-1/2}y^{3/4} - \lambda = 0 \]
\[ \mathcal{L}_y = \frac{3}{4}x^{1/2}y^{-1/4} - 2\lambda = 0 \]
\[ \mathcal{L}_\lambda = 0 \Rightarrow x + 2y = 30 \]

\[ x^{-1/2}y^{3/4} = 2\lambda \]
\[ x^{1/2}y^{-1/4} = \frac{8\lambda}{3} \]

Dividing the second equation by the first
\[ \frac{x^{1/2}y^{-1/4}}{x^{-1/2}y^{3/4}} = \frac{4}{3} \Rightarrow \frac{x}{y} = \frac{4y}{3} \Rightarrow x = \frac{4y}{3} \]
\[ \frac{4y}{3} + 2y = 30 \Rightarrow 10y = 90 \Rightarrow y = 9 \Rightarrow x = 12 \]

\[ x = 12, \quad y = 9 \]
