

## Khovanov Homology

**What is it?** A cube for each knot/link projection;

Vertices: All fillings of with or with .

Edges: All fillings of  $I \times$  = with  $I \times$  = or with  $I \times$  = and precisely one .

$$\begin{array}{c}
 \begin{array}{ccccc}
 dx & \xrightarrow{+} & dx \wedge dy & \xrightarrow{+} & dx \wedge dy \wedge dz \\
 \swarrow & \nearrow & \swarrow & \nearrow & \swarrow \\
 \begin{array}{c} \wedge dx \\ \wedge dy \\ \wedge dz \end{array} & \xrightarrow{+} & dy & \xrightarrow{-} & dx \wedge dz \\
 & \nearrow & \swarrow & \nearrow & \swarrow \\
 & & dx \wedge dy \wedge dz & \xrightarrow{+} & dy \wedge dz
 \end{array}
 \end{array}$$

**Where does it live?** In *Kom(Mat(<Cob> / {S, T, 4Tu})) / homotopy* :

*Kom*: Complexes   *Cob*: Cobordisms

*<...>*: Formal lin. comb.   *Mat*: Matrices

$S$ : = 0    $T$ : = 2

$$\begin{array}{c}
 \begin{array}{ccccc}
 & & & 4Tu & \\
 & \swarrow & \nearrow & \swarrow & \nearrow \\
 \begin{array}{c} \text{---} \\ \text{---} \end{array} & + & \begin{array}{c} \text{---} \\ \text{---} \end{array} & + & \begin{array}{c} \text{---} \\ \text{---} \end{array} \\
 & \nearrow & \swarrow & \nearrow & \swarrow \\
 & & \text{---} & & \text{---}
 \end{array}
 \end{array}$$

**Jones/Kauffman?**

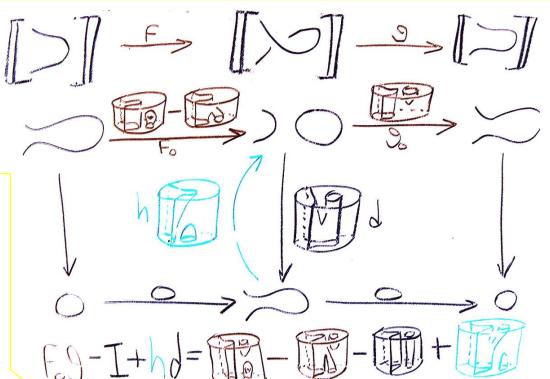

$$V^{\otimes 3} \longrightarrow (V^{\otimes 2} \oplus V^{\otimes 2} \oplus V^{\otimes 2})\{1\} \longrightarrow (V \oplus V \oplus V)\{2\} \longrightarrow V^{\otimes 2}\{3\}$$

A TQFT takes it to a complex whose graded Euler characteristic is the Jones polynomial.

The key point:  $\longrightarrow V = \langle v_+, v_- \rangle$ ,  $\deg v_{\pm} = \pm 1$   
 $q\text{-dim} V = q + q^{-1}$

**But is it invariant?**

(With similar proofs for R-II and R-III)

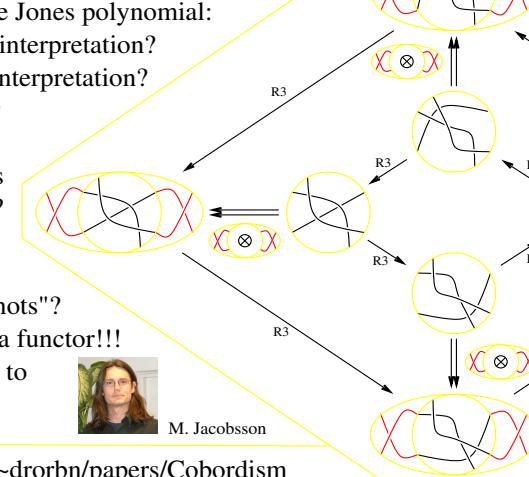

**Why is it interesting?**

1. It is stronger than the Jones polynomial.
2. It is less understood than the Jones polynomial:
  - a. Does it have a topological interpretation?
  - b. Does it have a "physical" interpretation?
  - c. Does it also work for other quantum invariants?
  - d. Does it work for manifolds and for knots in manifolds?
  - e. Is there a relation with finite-type invariants?
  - f. Does it work for "virtual knots"?
3. Jacobsson, Khovanov: It is a functor!!! (from knots and cobordisms to complexes and morphisms)
